

Water-Stressed Areas and COGS Assessment

JSC 'Dehqonobod Potash Plant'

When considering physical water scarcity issues at a local level, JSC “Dehqonobod Potash Plant” operates a single production facility located in Dehqonobod district, Kashkadarya region of Uzbekistan — an area classified as water-stressed due to limited freshwater availability.

Therefore, one (1) production site is located in a water-stressed area. As all production activities are carried out at this location, it represents 100% of the company’s Cost of Goods Sold (COGS) for the last fiscal year.

The company continuously monitors its water usage, implements recycling and water-efficiency measures, and maintains a closed-loop water circulation system to mitigate risks associated with water scarcity.
